

CathPCI Registry®

V4 Outcomes Report Companion Guide

The mission of the NCDR[®] is to improve the quality of cardiovascular patient CathPCI by providing information, knowledge and tools; implementing quality initiatives; and supporting research that improves patient CathPCI and outcomes.

The NCDR[®] is an initiative of the American College of Cardiology Foundation, with partnering support from the Society for Cardiovascular Angiography and Interventions for the CathPCI Registry.

CONFIDENTIALITY NOTICE

This document contains information confidential and proprietary to the American College of Cardiology Foundation. This document is intended to be a confidential communication between ACCF and participants of the CathPCI Registry and may involve information or material that may not be used, disclosed or reproduced without the written authorization of the ACCF. Those so authorized may only use this information for a purpose consistent with the authorization. Reproduction of any section of this document with permission must include this notice.

Overview

The CathPCI Registry Institutional Outcomes Report provides detailed analysis of a hospital's individual performance in relation to the entire registry population. This gives insight into care variations and quality improvement opportunities. The report provides the opportunity to compare hospital practice patterns to NCDR benchmarks.

| R4Q (Rolling Four | The four (4) consecutive quarters included in this report. (Example: |
|------------------------|---|
| Quarters) | The 2011Q1 report includes 2010Q2, 2010Q3, 2010Q4 and 2011Q1. |
| Quarters) | The "Q" in 'R4Q" indicates the last quarter of the rolling four |
| | quarters). |
| Benchmark Inclusion | Indicates whether a submission will be included in the R4Q aggregated data |
| Status | (benchmark) and comparison group statistics. "Green," "Yellow" and "Red" |
| Status | stoplights denote the status. |
| Green status | A "Green" status G indicates the submission (one quarter/timeframe) is included |
| | in the benchmark and comparison group statistics. The data has successfully |
| | passed all data assessment and completeness checks. |
| Yellow status | · · |
| I CHOW Status | A "Yellow" status \mathbf{Y} indicates the submission (one quarter/timeframe) is not |
| | included in the benchmark and comparison group statistics. Data is displayed in |
| | the quarterly column, but is not included in the "My Hospital R4Q" summary. |
| Red status | The data has not passed the overall completeness assessment checks. |
| Red status | A "Red" status ¹ indicates the submission (one quarter/timeframe) is not |
| | included in the benchmark or comparison group statistics. Data is not displayed in |
| NT 11 / / | the quarterly column. |
| Null status | A null or blank status indicates no submission has been received for that |
| Mar Hannital D4O | quarter/timeframe. Data is not displayed in the quarterly column. |
| My Hospital R4Q | The values for a metric/measure (over R4Q) of data submitted by your facility with a Benchmark Inclusion Status of "Green". |
| All Hospital 50th Pctl | The median (or midpoint or 50th percentile) of all participants' aggregated data |
| All Hospital Jour Pour | for the metric or measure. Half of all participants will be above the median, and |
| | half will be below. This value will correspond to the midpoint of the box/whisker |
| | plot with a Benchmark Inclusion Status of "Green". |
| All Hospital 90th Pctl | The 90th percentile of all participants' aggregated data for the metric or measure. |
| | 10% of all participants will be above the 90^{th} percentile value, and 90% will be |
| | below. This value will correspond to the right-most endpoint of the box/whisker |
| | plot with a Benchmark Inclusion Status of "Green". |
| Comparison Group Pts | Participating hospitals with same PCI annual volume based on reported data. |
| R4Q | |
| DQR | The online system used to check that data are well formed and complete. Data |
| | must first be submitted to the DQR to be included in the Outcomes Report. |

Frequently Used Terminology

Access to your Report

Step 1: Check Settings

- 1. Set privileges to ensure access to your Outcomes Reports on the NCDR Dashboard's Comparator and eReports page.
 - a. Your registry site manager (RSM) must check the box next to the Comparator and eReports privilege options within the **Site User Administration** menu for each user.
 - b. This privilege only needs to be set once.

Figure 1: Selecting Privileges: Outcomes Report

- 2. Set Email Preferences to receive the automated Outcomes Report notification.
 - a. Click Individual Profile from the Administration menu.
 - b. Check the box next to the privilege marked "Email me when the V4.0 Outcomes Report has been created"
 - c. This ensures you will receive an email when a new Outcomes Report is available for download.

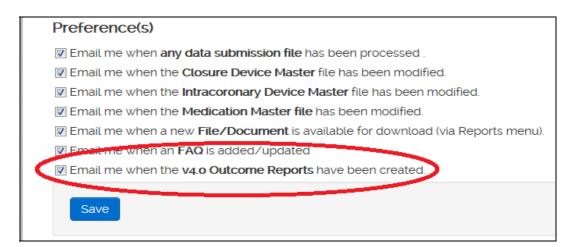

Figure 2: Selecting Email Preferences

Step 2: Download the Report

- 1) Login to the CathPCI Registry website
- 2) Select Dashboard from the left menu
 - You must have privileges set to access this function (See Step 1).

Specifications for Executive Summary Measures and Metrics

Section I: PCI Performance Measures

Endorsed by the National Quality Forum and appropriate for public reporting

| 1. PCI in-hospital r | isk adjusted mortality (all patients) | | |
|--|--|--|--|
| Description: The hospital risk adjusted mortality rate for patients having PCI | | | |
| Numerator | – See risk model technical specifications – page 37 | | |
| Denominator | | | |
| Time period | Four consecutive quarters | | |
| Clinical Rationale/ Recommendation | Although death in patients with serious heart disease is not completely unexpected, that rate (adjusted for case mix/patient risk factors) is sensitive to a number of controllable factors such as case selection, procedural judgment and operator skill, as well as institutional support and overall quality of care. | | |
| | The NCDR [™] risk adjustment model analyzes multiple elements to account for patient risk factors that are present prior to PCI. Risk adjustment "levels the playing field" among participating institutions and adjusts the "actual" mortality rate based on these factors. In other words, if you have several very sick patients die, your risk adjusted mortality rate would be lower than your actual mortality rate. If you had several very healthy patients die unexpectedly, your risk adjusted mortality rate would be higher than your actual mortality rate. Please refer to the detail section of the report and the risk adjustment technical notes for more information. | | |
| | Risk adjusted mortality does not show an "arrow" position on the Executive Summary if your hospital had no mortality for that quarter. The Current algorithm cannot calculate zero and will be updated. | | |
| Relevant Citations | Risk adjusted outcomes interpretation and specifications in the CathPCI Registry® - located on ncdr.com in the CathPCI Registry Resources/documents section. | | |

37. PCI in-hospital risk adjusted rate of bleeding events (all patients)

Description: The hospital risk adjusted rate of bleeding events for patients having PCI- retired and replaced with Metric 40 Risk Standardized Bleeding

40. PCI in-hospital risk standardized rate of bleeding events (all patients)

Description: The hospital risk adjusted rate of bleeding events for patients having PCI

| Numerator | See risk model technical specifications – page 41 |
|---------------------------------------|--|
| Denominator | |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Bleeding complications after PCI are associated with increased morbidity, mortality and costs. This measure is helpful in providing risk-adjusted feedback on bleeding complications, informing clinical decision-making, and directing the use of bleeding avoidance strategies to improve the safety of PCI procedures. |
| Relevant Citations | Risk adjusted outcomes interpretation and specifications in the CathPCI Registry® - located on ncdr.com in the CathPCI Registry Resources/documents section. CompanionGuide_NewRAB_March.2018 Authors: M. Simanowith & CAnderson, Last update 4/4/2018

38. Composite: Discharge Medications in Eligible PCI Patients

Description: Identifies PCI patients who received prescriptions for all medications (aspirin, P2Y12 Inhibitor and statin) for which they were eligible

| Numerator | Count of patients: |
|--------------------|---|
| | Who had ASA, Statin <i>and</i> a P2Y12 prescribed, contraindicated or blinded at discharge when a <i>stent <u>was</u> placed</i> during PCI |
| | OR |
| | Who had ASA and Statin prescribed, contraindicated or blinded at discharge when a <i>stent was <u>not</u> placed</i> during PCI |
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. Patients having PCI during admission |
| Exclusion Criteria | Discharge status of "deceased" Discharge location of "other acute care hospital", "hospice" or "against medical advice". |
| Timeframe | Four consecutive quarters |
| Clinical Rationale | See metrics 8, 9 and 10 |
| Relevant Citations | See metrics 8, 9 and 10 This measure has been endorsed by the National Quality Forum |

Note: PCI in-hospital risk adjusted mortality (all patients), PCI in-hospital risk adjusted bleeding (all patients), and Composite: Discharge Medications in Eligible PCI patients are three performance measures in the CathPCI Registry that have been endorsed by the National Quality Forum. Such performance measures meeting the requirement for approval are intended not only for clinical quality improvement, but also may be considered for purposes of public reporting.

The "Registry Metrics" on the subsequent pages of this report are those measures that have been developed to support self assessment and quality improvement at the provider, hospital, and/or health care system level. While these metrics have not been formally developed by the American College of Cardiology/American Heart Association Task Force for Performance Measures Task Force, they may be identified as evolving' measures worthy of consideration for further development into performance measures.

Section II: Quality Metrics – to support self assessment and quality improvement at the provider, hospital, and/or health care system level.

PCI Process Metrics

| 2. Proportion of ele | ective PCIs with prior positive stress or imaging study |
|---------------------------------------|--|
| Description: Identifie | es PCI procedures with a prior positive stress or imaging study or an FFR ratio ≤ 0.8 |
| Numerator | Count of PCI procedures with a "Positive" stress or imaging study <i>or</i> a fractional flow reserve (FFR) ratio of <=0.8 |
| Denominator | Count of PCI procedures |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. Elective PCI Procedure |
| Exclusion Criteria | CAD Presentation of "Unstable Angina", "NSTEMI" or "STEMI" CCS IV Anginal Classification Staged PCI Cardiac Transplant Evaluation |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Several studies have established that for patients with stable CAD outcomes do not differ between PCI with medical therapy and medical therapy alone. Noninvasive testing prior to elective PCI for patients with stable CAD (without acute coronary syndrome) can help select patients that will benefit from PCI. |
| | The 2012 appropriateness criteria for coronary revascularization require that, for patients without acute coronary syndromes, results from non-invasive testing be either low-risk, intermediate risk, or high risk, or that results from FFR be ≤ 0.80 be used to validate the need for revascularization. |
| | A positive result on stress or imaging studies and/or FFR is suggestive of ischemia. |

3. Median time to immediate PCI for STEMI patients (in minutes)

Description: Identifies the hospital median time to PCI in minutes for STEMI patients N / 1' .. 1 0 . 1. • --.... .

| Median | Median time for STEMI PCI procedures <i>from</i> "Arrival date/time" <i>or</i> STEMI noted on "Subsequent ECG date/time" <i>to</i> "First Device Activation date/time" |
|---------------------------------------|---|
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. PCI procedures with PCI Indication of "Immediate PCI for STEMI" |
| Exclusion Criteria | "Non-system reason for delay" <i>and</i> a time to "First Device Activation date/time" of >90 minutes Transferred In for Immediate PCI for STEMI |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | According the the ACC/AHA performance measures for STEMI/NSTEMI report, "Acute reperfusion therapy for patients with STEMI significantly reduces the risk of death and should be provided to all eligible patients." Hospital policies and procedures materially affect door-to-balloon time. This measure is insensitive to differences in case mix. |
| | ACC/AHA guidelines for the management of patients with ST-elevation myocardial infarction recommends: "Primary PCI should be performed as quickly as possible with a goal of a medical contact–to-balloon or door-to-balloon interval of within 90 minutes." |
| Relevant Citations | Krumholz HM, Anderson JL, Bachelder BL, et al. ACC/AHA 2008 performance measures for adults with ST-elevation and non–ST-elevation myocardial infarction: a report of the American College of Cardiology/American Heart Association Task Force on Performance Measures (Writing Committee to Develop Performance Measures for ST-Elevation and Non–ST-Elevation Myocardial Infarction). J Am Coll Cardiol 2008;52:2046–99. |

4. Proportion of STEMI patients receiving immediate PCI w/in 90 minutes

Description: Identifies STEMI patients with a time to PCI of <=90 minutes

| Numerator | Count of STEMI PCI procedures with "Arrival date/time" <i>or</i> STEMI noted on "Subsequent ECG date/time" <i>to</i> "First Device Activation date/time" of <=90 minutes |
|---------------------------------------|--|
| Denominator | Count of PCI procedures |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. PCI procedures with PCI Indication of "Immediate PCI for STEMI" |
| Exclusion Criteria | "Non-system reason for delay" <i>and</i> a time to "First Device Activation date/time" of >90 minutes Transferred In for Immediate PCI for STEMI |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | See metric 3. |
| Relevant Citations | See metric 3. |

Page 11 of 52

5. Median time from ED arrival at STEMI transferring facility to ED arrival at STEMI receiving facility among transferred patients.

| Description: Identifies the hospital median time from transferring facility to arrival at PCI facility for STEMI |
|---|
| patients |

| Median | Median time for STEMI patients who are "Transferred In for Immediate PCI for STEMI" <i>from</i> "ED Presentation at Referring Facility date/time" <i>or</i> STEMI noted on "Subsequent ECG date/time" <i>to</i> "Arrival date/time" |
|---------------------------------------|---|
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedures with PCI Indication of "Immediate PCI for STEMI" Transferred In for Immediate PCI for STEMI |
| Exclusion Criteria | Admit Source of 'Emergency department' or 'Other' |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Class I: 1. Patients with STEMI who have cardiogenic shock and are less than 75 years of age should be brought immediately or secondarily transferred to facilities capable of cardiac catheterization and rapid revascularization (PCI or CABG) if it can be performed within 18 hours of onset of shock. (Level of Evidence: A) |
| | 2. Patients with STEMI who have contraindications to fibrinolytic therapy should be brought immediately or secondarily transferred promptly (i.e., primary receiving hospital door-to-departure time less than 30 minutes) to facilities capable of cardiac catheterization and rapid revascularization (PCI or CABG). (Level of Evidence: B) |
| Relevant Citations | See metric 3. |

6. Median time from ED arrival at STEMI transferring facility to immediate PCI at STEMI receiving facility among transferred patients (in minutes).

| Description: Identifies the hospital median time from transferring facility to PCI at receiving facility for STEMI patients | |
|--|---|
| Median | Median time for STEMI patients who are "Transferred In for Immediate PCI for STEMI" <i>from</i> "ED Presentation at Referring Facility date/time" <i>or</i> STEMI noted on "Subsequent ECG date/time" <i>to</i> "First Device Activation date/time" |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. PCI procedures with PCI Indication of "Immediate PCI for STEMI" Transferred In for Immediate PCI for STEMI |
| Exclusion Criteria | "Non-system reason for delay" <i>and</i> a time to "First Device Activation date/time" of >90 minutes Admit Source of 'Emergency department' or 'Other' |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | According to the ACC/AHA performance measures for STEMI/USTEMI report, "The benefits of timely acute reperfusion for STEMI with either fibrinolysis or primary percutaneous coronary intervention (PCI) are substantial. In centers where PCI is not available on-site, patients may be transferred to another facility for treatment. Because delayed PCI may not be as beneficial as timely fibrinolysis, opting for transfer for PCI rather than fibrinolysis requires that transfer be performed in a timely manner." |
| | Class I: 1. Patients with STEMI who have cardiogenic shock and are less than 75 years of age should be brought immediately or secondarily transferred to facilities capable of cardiac catheterization and rapid revascularization (PCI or CABG) if it can be performed within 18 hours of onset of shock. (Level of Evidence: A) |
| | 2. Patients with STEMI who have contraindications to fibrinolytic therapy should be brought immediately or secondarily transferred promptly (i.e., primaryreceiving hospital door-to-departure time less than 30 minutes) to facilities capable of cardiac catheterization and rapid revascularization (PCI or CABG). (Level of Evidence: B) |
| Relevant Citations | See metric 3 |

Page 13 of 52

7. Median fluoro time (in minutes)

Description: Identifies the median flouro time for PCI procedures Median Flouro time Inclusion Criteria Data from submissions that pass NCDR data inclusion thresholds PCI procedures (with or without diagnostic cath) **Exclusion** Criteria Prior CABG Other Procedure PCI of >1 vessel/lesion Time period Four consecutive quarters Clinical Rationale/ 2011 PCI Guidelines - 4.3. Radiation Safety - CLASS I Recommendation: Cardiac Recommendation catheterization laboratories should routinely record relevant available patient procedural radiation dose data (e.g., total air kerma at the international reference point [Ka r], air kerma air product [PKA], fluoroscopy time, number of cine images), and should define thresholds with corresponding follow-up protocols for patients who receive a high procedural radiation dose. (Level of Evidence: C) **Relevant Citations** 2011 PCI Guidelines (J Am Coll Cardiol 2011; 58:e44–122)

| 8. Proportion of patients with aspirin prescribed at discharge | |
|--|---|
| Description: Identifies | s PCI patients who were prescribed aspirin |
| Numerator | Count of patients with ASA prescribed, contraindicated or blinded at discharge |
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI during the Episode of Care |
| Exclusion Criteria | Discharge status of "deceased" Discharge location of "other acute care hospital", "hospice" or "against medical advice" |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | The 2011 PCI Guidelines - 5.7.2. Oral Antiplatelet Therapy Class I Recommendations: 3. After PCI, use of aspirin should be continued indefinitely. (Level of Evidence: A) |
| Relevant Citations | 2011 PCI Guidelines (J Am Coll Cardiol 2011; 58:e44–122) |

Page 14 of 52

 $\ensuremath{\mathbb{C}}$ 2015 by American College of Cardiology Foundation

CompanionGuide_NewRAB_March.2018 Authors: M. Simanowith & CAnderson, Last update 4/4/2018

9. Proportion of patients with a P2Y12 inhibitor prescribed at discharge (patients with stents)

Description: Identifies PCI patients with a stent implanted who were prescribed a Thienopyridine or P2Y₁₂ Inhibitor

| Numerator | Count of patients with a Thienopyridine or $P2Y_{12}$ Inhibitor (Clopidogrel, Prasugrel, Ticlopidine <i>or</i> Ticagrelor) prescribed, contraindicated or blinded at discharge |
|---------------------------------------|---|
| Denominator | Count of PCI admissions with stent implantation |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds Patients having PCI during the Episode of Care Stent implanted |
| Exclusion Criteria | Discharge status of "deceased" Discharge location of "other acute care hospital", "hospice" or "against medical advice" |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | The 2011 PCI Guidelines - 5.7.2. Oral Antiplatelet Therapy Class I Recommendations: 7. The duration of P2Y12 inhibitor therapy after stent implantation should generally be as follows: a. In patients receiving a stent (BMS or DES) during PCI for ACS, P2Y12 inhibitor therapy should be given for at least 12 months. Options include clopidogrel 75 mg daily, prasugrel 10 mg daily, and ticagrelor 90 mg twice daily. (Level of Evidence: B) b. In patients receiving DES for a non-ACS indication, clopidogrel 75 mg daily should be given for at least 12 months if patients are not at high risk of bleeding. (Level of Evidence: B) c. In patients receiving BMS for a non-ACS indication, clopidogrel should be given for a minimum of 1 month and ideally up to 12 months (unless the patient is at increased risk of bleeding; then it should be given for a minimum of 2 weeks). (Level of Evidence: B) |
| Relevant Citations | 2011 PCI Guidelines (J Am Coll Cardiol 2011; 58:e44–122) |

Page 15 of 52

| 10. Proportion of patients with a statin prescribed at dischargeDescription: Identifies PCI patients who were prescribed a statin | |
|--|--|
| Numerator | Count of patients with Statin prescribed, contraindicated or blinded at discharge |
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds. Patients having PCI during the Episode of Care |
| Exclusion Criteria | Discharge status of "deceased" Discharge location of "other acute care hospital", "hospice" or "against medical advice" |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Reducing LDL-c is associated with a decrease in mortality and morbidity for patients with coronary artery disease. Lipid-lowering therapy can reduce the risk of cardiovascular outcomes. |
| | 2011 AHA/ACCF Secondary Prevention Guidelines class I recommendation for lipid management: In addition to therapeutic lifestyle changes, statin therapy should be prescribed in the absence of contraindications or documented adverse effects (25–29). (Level of Evidence: A) |
| | 2. The ACC/AHA 2007 UA/NSTEMI Guidelines recommend: |
| | Class I Recommendation: Hydroxymethyl glutaryl-coenzyme A reductase inhibitors (statins), in the absence of contraindications, regardless of baseline LDL- C and diet modification, should be given to post-UA/NSTEMI patients, <u>including postrevascularization patients</u> . (<i>Level of</i> <i>Evidence: A</i>). |
| | For UA/NSTEMI patients with elevated LDL-C (greater than or equal to 100 mg per dL), cholesterol-lowering therapy should be initiated or intensified to achieve an LDL-C of less than 100 mg per dL (<i>Level of Evidence: A</i>). |
| Relevant Citations | AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients With Coronary and Other Atherosclerotic Vascular Disease: 2011 Update (JACC 2011, Vol. 58, No. 23) ACC/AHA 2007 Guidelines for the Management of Patients With Unstable Angina/Non–ST-Elevation Myocardial Infarction:J Am Coll Cardiol, 2007; 50:1- 157; |

Quality Metrics – PCI Outcome Metrics:

Page 16 of 52

11. Proportion of patients with vascular access site injury requiring treatment or major bleeding retired and replaced with risk adjusted bleeding metric (#37)

| 12. Proportion of patients with emergency CABG post PCI | |
|--|--|
| Description: Identifies PCI patients who had post procedure emergency CABG | |
| Numerator | Count of patients with "Emergency" CABG after a PCI procedure |
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedure |
| Exclusion Criteria | Emergency CABG date occurs prior to PCI procedure date |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Emergency CABG following PCI is considered one of the major complications that are associated with the PCI procedure and its success. |
| | Studies have demonstrated that patient and institutional characteristics, including competency and procedure volume, are related to rates of emergency CABG following PCI. |
| | The strongest patient predictors of the need for emergency CABG in several analyses are cardiogenic cardiogenic shock (OR: 11.4), acute MI or emergency PCI (OR: 3.2 to 3.8), multivessel disease (OR: 2.3 to 2.4), and type C lesion (OR: 2.6) (243, 245). Inhospital mortality for emergency CABG ranges from 7.8% to 14% (2011 PCI guidelines). |
| Relevant Citations | Levine GN, et al. 2011 ACCF/AHA/SCAI guideline for percutaneous coronary intervention: a report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiography and Interventions. | 13. Proportion of patients with post procedure Myocardial Infarction (among hospitals routinely collecting post-PCI biomarkers) | |
|---|--|
| Description: Identifi | ies PCI patients who had an intra or post procedure MI |
| Numerator | Count of patients with intra or post procedure MI |
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds Elective PCI procedures |
| Exclusion Criteria | Submissions with < 90% of patients with biomarkers (troponin and/or CK) coded post procedure LOS <1 day |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | MI following PCI is a major complication that is associated with the success of the PCI procedure. Studies debate the most accurate way to define post procedure MI (with or without routine collection of biomarkers). Post procedure MI increases patient morbidity and mortality, as well as health care resource use. |
| | There is evidence that hospitals that routinely collect biomarkers have a higher rate of periprocedural MI than those who don't. Thus this metric is reported separately, based on the routine collection of biomarkers (see metric 14 as well). |
| | "Hospitals that routinely performed marker testing had higher rates of periprocedural MI detection despite a trend toward lower mortality and greater adherence to recommended medications that suggest better overall quality of care for PCI patients at these hospitals. Therefore, in the absence of routine cardiac marker surveillance after PCI, the use of periprocedural MI as a quality metric for PCI will be misleading." ¹ |

Description: Identifies PCI patients who had an intra or post procedure MI

15. Proportion of patients with acute kidney injury retired and replaced with risk adjusted acute kidney injury metric (#39)

Page 19 of 52

| 16. Proportion of patients with post procedure stroke | | | |
|---|---|--|--|
| Description: Identifies | Description: Identifies PCI patients who had a CVA/stroke post procedure | | |
| Numerator | Count of patients with post procedure stroke | | |
| Denominator | Count of PCI procedures | | |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedures | | |
| Exclusion Criteria | Patients with "CABG" or "other major surgery" during same admission | | |
| Time period | Four consecutive quarters | | |
| Clinical Rationale/ Recommendation | Stroke is one of the major complications occurring after PCI | | |
| Relevant Citations | 2011 PCI Guidelines (J Am Coll Cardiol 2011; 58:e44–122) Fuchs S, Stabile E, Kinnaird TD, et al. Stroke complicating percutaneous coronary interventions: incidence, predictors, and prognostic implications. | | |

Page 20 of 52

17. Composite: Proportion of patients with death, emergency CABG (post PCI), stroke or repeat target vessel revascularization

Description: Identifies PCI patients who had at least one of the following: death, emergency CABG, stroke or repeat target vessel revascularization¹

¹Target vessel revascularization is defined as a repeat PCI procedure on the same segment during the same Episode of Care

| Numerator | Count of patients with a discharge status of deceased; an emergency CABG (post PCI), CVA/stroke <i>or</i> repeat target vessel revascularization |
|---------------------------------------|--|
| Denominator | Count of PCI admissions |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedure |
| Exclusion Criteria | Patients with "CVA/Stroke" and "elective", "urgent" or "salvage" CABG |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | This measure represents a composite of major complications occurring after PCI. |

| 18. PCI in-hospital risk adjusted mortality (patients with STEMI) | | |
|---|---|--|
| Description: The hospi | Description: The hospital risk adjusted mortality rate for with ST-elevation MI patients having PCI | |
| Numerator | See risk model technical specifications | |
| Denominator | | |
| Inclusion Criteria | PCI admissions with STEMI | |
| Time period | Four consecutive quarters | |
| Clinical Rationale/ Recommendation | See measure #1 | |
| Relevant Citations | See measure #1 | |

| 19. PCI in-hospital risk adjusted mortality (STEMI patients excluded) | | | |
|---|--|--|--|
| Description: The hospit | Description: The hospital risk adjusted mortality rate for patients without ST-elevation MI having PCI | | |
| Numerator | See risk model technical specifications | | |
| Denominator | | | |
| Exclusion Criteria | PCI admissions with STEMI | | |
| Time period | Four consecutive quarters | | |
| Clinical Rationale/ Recommendation | See measure #1 | | |
| Relevant Citations | See measure #1 | | |

| 25. Proportion of PCI procedures with transfusion of whole blood or red blood cells | | | |
|---|--|--|--|
| Description: Identifies | Description: Identifies PCI patients who received RBC/whole blood transfusion intra or post-procedure | | |
| Numerator | Count of PCI procedures with RBC/whole blood transfusion | | |
| Denominator | Count of PCI procedures | | |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedure | | |
| Exclusion Criteria | "CABG" or "other major surgery" during the same Episode of Care Transfusions administered for a pre-procedure hemoglobin of <=8g/dL | | |
| Time period | Four consecutive quarters | | |
| Clinical Rationale/ Recommendation | The purpose of this metric is to allow identification of potential overuse of transfusion after PCI procedures. In addition, it points out blood loss, which predicts poor outcomes. | | |

| 39. PCI in-hospital Risk Adjusted Acute Kidney Injury (all patients) | |
|--|---|
| Description: The hosp | pital risk adjusted rate of acute kidney injury for patients having PCI |
| Numerator | |
| Denominator | See risk model technical specifications - page 44 |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Acute Kidney Injury (AKI) is a serious complication after PCI and is associated with increased incidence of in-hospital and follow-up myocardial infarction, dialysis and death. Furthermore, small increases in serum creatinine have been associated with increased hospital length of stay and excess costs. This metric is helpful in providing risk-adjusted feedback on AKI, informing clinical decision-making, and directing the use of strategies to avoid AKI and improve the safety of PCI procedures. |
| Relevant Citations | Risk adjusted outcomes interpretation and specifications in the CathPCI Registry® - located on ncdr.com in the CathPCI Registry Resources/documents section. Page 24 of 52

| 20. Incidence of non-obstructive CAD | |
|---------------------------------------|--|
| Description: Identifies | s patients with non-obstructive coronary artery disease |
| Numerator | Count of diagnostic coronary angiography procedures with <i>all</i> coronary anatomy territories having <50% stenosis |
| Denominator | Diagnostic Coronary Angiography procedures |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds Elective diagnostic coronary angiography |
| Exclusion Criteria | Prior CABG Pre-operative evaluation before non-cardiac surgery Cardiac transplant evaluation type of " Donor for cardiac transplant" Rx recommendation after diagnostic cath of "Other cardiac therapy w/out CABG/PCI" Data submissions with Population Status 'A' (submitting PCI only) |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | This purpose of this metric is to identify diagnostic cath procedures with "normal" results. |
| | Because the constellation of findings characteristic of heart disease is non-specific, there will (and should) be patients who undergo diagnostic catheterization who have insignificant coronary artery disease. |
| | However, given the potential for physicians to vary with respect to their threshold for recommending diagnostic catheterization, it is important for hospitals to have a process that permits that variation to be recognized, discussed, and managed. |

21. Proportion of diagnostic catheterization procedures with vascular access site injury requiring treatment or major bleeding

Description: Identifies patients having diagnostic cath that experienced access site related injury and/or bleeding

| Numerator | Count of diagnostic cath procedures <i>with</i> "Access Site", "Hematoma", Retroperitoneal Bleeding" <i>and/or</i> "Other Vascular Complications Requiring Treatment" |
|---------------------------------------|---|
| Denominator | Count of diagnostic cath procedures |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds Diagnostic coronary angiography |
| Exclusion Criteria | PCI procedure during the same Episode of Care. "CABG" or "other major surgery" during the same Episode of Care Bleeding specific to "GI", "GU" and/or "Other Bleed" |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Vascular complications can cause significant discomfort and disability for patients. While rates of complication will be sensitive to patient characteristics (and therefore case mix), there is evidence that hospitals can significantly influence overall complication rates. This can be accomplished through monitoring and analyzing the causes of complications, developing policies and procedures that minimize the risk of complications, and developing policies that assure operator and cath team competency. |
| Relevant Citations | Mehran R, Rao SV, Bhatt DL et al. Standardized bleeding definitions for cardiovascular clinical trials: a consensus report from the Bleeding Academic Research Consortium. Circulation 2011;123:2736-47. |

Utilization Metrics:

| 22. Median post-procedure length of stay (in days) for PCI patients with STEMI | | | |
|--|---|--|--|
| Description: The hosp | Description: The hospital median post-procedure length of stay for STEMI patients | | |
| Median | Median time in days from "Procedure Date" to "Discharge Date" for STEMI patients | | |
| Inclusion Criteria | Data from submissions that pass NCDR data inclusion thresholds PCI procedures for STEMI | | |
| Exclusion Criteria | Invalid values for "Admission Date", "Procedure Date" or "Discharge Date" | | |
| Time period | Four consecutive quarters | | |
| Clinical Rationale/ Recommendation | Median LOS will be sensitive to patient characteristics (and therefore case mix). However, there is evidence that hospitals can influence total, pre and post procedure LOS, maximizing efficient resource usage. | | |

23. Median post-procedure length of stay (in days) for PCI patients with no STEMI

Description: Your hospital's median post-procedure length of stay (in days) for PCI patients with no STEMI. This metric was retired in the 2011 q1 report

© 2015 by American College of Cardiology Foundation CompanionGuide_NewRAB_March.2018 Authors: M. Simanowith & CAnderson, Last update 4/4/2018

Data Quality Metrics:

24. Proportion of PCI procedures with creatinine assessed pre and post PCI procedure

Description: Identifies PCI patients with creatinine assessed pre and post procedure.

| Numerator | PCI procedures with creatinine assessed pre and post procedure |
|---------------------------------------|--|
| Denominator | PCI procedures |
| Inclusion Criteria | Data submissions that passed NCDR data inclusion thresholds PCI procedures |
| Exclusion Criteria | Patients with "Death in Lab" LOS <1day Invalid value for "Pre or Post-procedure Creatinine" values |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Acute kidney injury, or "contrast induced nephropathy" is a major, procedure-related complication of PCI. The "risk, injury, failure, loss, end-stage" (RIFLE) classification requires pre and post procedure creatinine to classify acute kidney injury (AKI). The 2011 PCI Guidelines - 4.4. Contrast-Induced AKI Class I Recommendations: Patients should be assessed for risk of contrast induced AKI before PCI. (Level of Evidence: C) Patients undergoing cardiac catheterization with contrast media should receive adequate preparatory hydration. (Level of Evidence: B) In patients with CKD (creatinine clearance <60 mL/min), the volume of contrast media should be minimized. (Level of Evidence: B) |

Γ

Section III: PCI Appropriate Use Criteria (AUC) Metrics

Metrics 30-36 stratify patients with acute coronary syndrome and patients without acute coronary syndrome according to Appropriate Use Criteria guidelines

| 30. Proportion of PCI procedures not classifiable for AUC reporting | |
|---|--|
| Description: Identifies | s PCI procedures that were not able to be classified by the AUC |
| Numerator | PCI Procedures that could not be mapped to an Appropriate Use Criteria Indication |
| Denominator | PCI Procedures |
| Inclusion Criteria | Data submissions that passed NCDR data inclusion thresholds PCI procedures |
| Exclusion Criteria | There are no exclusions for this measure |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Variables associated with defining the patient's unique clinical scenario or PCI indication are either missing and/or indeterminant. |
| | An AUC indication cannot be identified to associate with the patient scenario. |
| Relevant Citations | Appropriate Use Criteria for Coronary Revascularization Focused Update developed by the ACC, Society for Cardiovascular Angiography and Interventions, Society of Thoracic Surgeons, American Heart Association, and other national societies and published in the Journal of the American College of Cardiology (<i>J Am Coll Cardiol</i> 2012;59: 857-81) |

Page 30 of 52

31. Patients WITH Acute Coronary Syndrome: Proportion of evaluated PCI procedures that were appropriate

| Numerator | PCI Procedures evaluated as "Appropriate" according to Appropriate Use Criteria guidelines |
|--|--|
| Denominator | PCI Procedures |
| Inclusion Criteria | Data submissions that passed NCDR data inclusion thresholds PCI procedures |
| Exclusion Criteria | CAD Presentation of "No Sx/No Angina", "Sx unlikely to be ischemic" or "Stable Angina" |
| Exclusion Criteria at the Facility level | If more than 40% of a facility's PCIs are not classified or calculated using the AUC model, their data is not displayed in this metric. It is also not displayed in the "My Hospital R4Q" column, and is not included in the national benchmark (the "All Hospital Pts R4Q" column) for the detail lines that report AUC (starting on line 1572). |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Coronary revascularization is appropriate when the expected benefits, in terms of survival or health outcomes (symptoms, functional status, and/or quality of life) exceed the expected negative consequences of the procedure. |
| | An 'appropriate' rating indicates that coronary revascularization is generally acceptable and is a reasonable approach for the indication and is likely to improve the patients' health outcomes or survival. |
| Relevant Citations | Appropriate Use Criteria for Coronary Revascularization Focused Update developed by the ACC, Society for Cardiovascular Angiography and Interventions, Society of Thoracic Surgeons, American Heart Association, and other national societies and published in the Journal of the American College of Cardiology (<i>J Am Coll Cardiol</i> 2012;59: 857-81) |

Description: Identifies PCI procedures with ACS that were determined to be appropriate by the AUC

Page 31 of 52

| 32. Patients WITH Acute Coronary Syndrome: Proportion of evaluated PCI procedures that were of uncertain appropriateness | |
|---|--|
| Description: Identifies | PCI procedures with ACS that were determined to be uncertain by the AUC |
| Numerator | PCI Procedures evaluated as "Uncertain" according to Appropriate Use Criteria guidelines |
| Denominator | PCI Procedures |
| Inclusion Criteria | Data submissions that passed NCDR data inclusion thresholds PCI procedures |
| Exclusion Criteria | CAD Presentation of "No Sx, No Angina", "Sx unlikely to be ischemic" and "Stable Angina" |
| Exclusion Criteria at the Facility level | If more than 40% of a facility's PCIs are not classified or calculated using the AUC model, their data is not displayed in this metric. It is also not displayed in the "My Hospital R4Q" column, and is not included in the national benchmark (the "All Hospital Pts R4Q" column) for the detail lines that report AUC (starting on line 1572). |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | Uncertainty implies that more research and/or patient information is needed to classify the indication definitively. Revascularization may be reasonable, yet there is limited data on clinical benefit. |
| | An "Uncertain" rating indicates coronary revascularization may be acceptable and may be a reasonable approach for the indication. However, some degree of uncertainty exists, implying that more research and/or patient information is needed to determine whether the procedure would improve patients' health outcomes or survival. |
| Relevant Citations | Appropriate Use Criteria for Coronary Revascularization Focused Update developed by the ACC, Society for Cardiovascular Angiography and Interventions, Society of Thoracic Surgeons, American Heart Association, and other national societies and published in the Journal of the American College of Cardiology (<i>J Am Coll Cardiol</i> 2012;59: 857-81) |

Page 32 of 52

33. Patients WITH Acute Coronary Syndrome: Proportion of evaluated PCI procedures that were inappropriate

Description: Identifies PCI procedures with ACS that were determined to be inappropriate by the AUC

| Numerator | PCI Procedures evaluated as "Inappropriate" according to Appropriate Use Criteria guidelines |
|---|--|
| Denominator | PCI Procedures |
| Inclusion Criteria | Data submissions that passed NCDR data inclusion thresholds PCI procedures |
| Exclusion Criteria | CAD Presentation of "No Sx, No Angina", "Sx unlikely to be ischemic" and "Stable Angina" |
| Exclusion Criteria at the Facility level | If more than 40% of a facility's PCIs are not classified or calculated using the AUC model, their data is not displayed in this metric. It is also not displayed in the "My Hospital R4Q" column, and is not included in the national benchmark (the "All Hospital Pts R4Q" column) for the detail lines that report AUC (starting on line 1572). |
| Time period | Four consecutive quarters |
| Clinical Rationale/ Recommendation | A rating of "Inappropriate" indicates that the indication provided for the PCI is not generally acceptable and is not a reasonable approach. |
| | An "Inappropriate" rating indicates that coronary revascularization is not generally acceptable and is not a reasonable approach for the PCI indication and is unlikely to improve the patients' health outcomes or survival. |
| Relevant Citations | Appropriate Use Criteria for Coronary Revascularization Focused Update developed by the ACC, Society for Cardiovascular Angiography and Interventions, Society of Thoracic Surgeons, American Heart Association, and other national societies and published in the Journal of the American College of Cardiology (<i>J Am Coll Cardiol</i> 2012;59: 857-81) |

Risk Models

Risk Model #1 – Performance Measure #1: PCI in-hospital Risk Adjusted Mortality (all patients)

The most recent PCI risk-adjusted mortality model revision was developed using patients discharged between July 1, 2009 and June 30, 2011. A total of 1,216,756 admissions with patients undergoing PCI at 1,253 hospitals in the United States were included in the model development and validation cohort.

Outcome:

Mortality (discharge status of deceased)

Model Eligibility and Population Definition

- Model eligibility at the <u>facility</u> level:
 - 1. Data submissions that passed NCDR data inclusion thresholds
- Model eligibility at the <u>patient</u> level:
 - 1. Include patients with a PCI procedure performed during the Episode of Care.
 - 2. Include only index PCI procedures when patients have multiple PCI procedures (subsequent PCIs during a single Episode of Care are excluded).
 - 3. Exclude patients (patient variables) who transfer to another 'acute care facility' on discharge (9045).

CompanionGuide_NewRAB_March.2018 Authors: M. Simanowith & CAnderson, Last update 4/4/2018

Confidential - Not for Release. All Rights Reserved. None of this material may be further distributed, released or reproduced without the express prior consent of ACCF.

Risk Adjusted Mortality detail line labels in the Outcomes Report and explanations:

• Eligible Patients - all patients who receive a predicted probability value from the model

• Observed Mortality - count of occurrences of mortality (number of deceased patients)

• Expected Mortality - predicted rate of mortality for the eligible patients (number of patients expected to die)

• The **Observed/Expected Mortality Ratio** - (O/E Ratio) provides feedback on the comparison between the observed to expected

• Risk Adjusted Rate - your hospital risk adjusted mortality rate

• The **Registry Aggregate Observed Mortality Rate** - the registry mortality rate and reflective of the patients included in the reporting period. It is therefore dynamic and changes based on these data from each quarter and R4Q

O/E Ratio x Registry Aggregate = Risk Adjusted Rate

Variables

| VARIABLE | VARIABLE TYPE | Elements | NOTES |
|---|-----------------------|---|---|
| Age <=70 | Discrete (yes or no) | DOB (2050); Arrival Date (3000) | |
| Age >70 | Linear or continuous* | DOB (2050); Arrival Date (3000) | Coefficient changes in weight with an increase in age >70 |
| Body Mass Index <= 30 | Discrete (yes or no) | Ht and Wt (4055 and 4060) | |
| Body Mass Index >30 | Linear or continuous* | Ht and Wt (4055 and 4060) | Coefficient changes in weight with an increase in BMI >30 |
| ST-segment elevation MI | Discrete (yes or no) | CAD presentation= STEMI (5000); or PCI indication=PCI for STEMI (7020 with codes 1,2,3,4,5) | |

* Linear or continuous variables are typically variables that are numbers (weight, age, BMI). These variables have coefficients or weights that change based on the value of the variable.

Results

In-hospital mortality for the NCDR was 1.4% and ranged from 0.2% for elective cases (representing nearly half of all patients with PCI) to 71.8% among patients with shock and recent cardiac arrest (representing 0.2% of patients with PCI) when the model was developed. In predicting risk, the majority of patients (>95%) had a predicted mortality risk of <5%, and a small minority of patients (<1.5%) had a predicted risk of >20%.

In the CathPCI Registry Outcome Reports, risk-adjusted mortality is reported three ways:

- 1. All patients
- 2. Patients with ST-elevation myocardial infarction
- 3. Patients without ST-elevation myocardial infarction

Risk Model #2 – Metric 40 PCI in-hospital Risk Standardized Bleeding (all patients)

The PCI risk-adjusted bleeding model was updated in 2017 to a parsimonious hierarchical model. This means the risk model utilizes less patient variables (than the previous model) to determine individual patient risk of bleeding and the model will take into account the risk relationships within and amongst hospitals (not utilized by the previous model and a hierarchical model feature). Additionally, the hemoglobin parameter used to determine if a Post-PCI bleeding event has occurred, has been revised to assess an absolute hemoglobin (hgb) decrease from pre-PCI to post-PCI of $\geq 4g/dL$ (previously 3g/dL).

The Risk Adjusted Bleeding model provides accurate estimates of post-PCI bleeding risk and is helpful in providing risk-adjusted feedback on bleeding complications, informing clinical decision-making, and directing the use of bleeding avoidance strategies to improve the safety of PCI procedures.

Model Details

Outcome:

Post-PCI bleeding defined as any ONE of the following:

- 1. Bleeding event w/in 72 hours (8050); OR
- 2. Hemorrhagic stroke (8021); OR
- 3. Tamponade (8025); OR
- 4. Post-PCI transfusion (8040) for patients with a pre-procedure hgb >8 g/dL and pre-procedure hgb not missing; OR
- 5. Absolute hgb decrease (7320 and 7345) from pre-PCI to post-PCI of >= 4 g/dl (excluded if any of the following: pre-procedure (7320) hgb>16g/dl *or* IABP (5330) = yes *or* MVSupport (5340) = yes)

Model Eligibility and Population Definition

- Model eligibility at the <u>facility</u> level:
 - 1. Data submissions that passed NCDR data inclusion thresholds
 - 2. Facilities must have at least one patient with a pre-PCI (7320) or post-PCI hgb (7345) value to be eligible for analysis
- Model eligibility at the <u>patient</u> level:
 - 1. Include patient's with a PCI procedure performed during the Episode of Care
 - 2. Include only index PCI procedures when patients have multiple PCI procedures (subsequent PCIs during a single Episode of Care are excluded).
 - 3. Include patient procedures with non-missing values for outcome variables of bleeding event w/in 72 hours (8050) AND transfusion (8040).
 - 4. Exclude patients who died on the same day of the procedure [Discharge date (9035)=procedure date (5300) AND discharge status=deceased (9040)]
 - 5. Exclude patients with CABG (9000)=yes

Risk Adjustment Variables

| VARIABLE | VARIABLE TYPE | ELEMENTS | Notes |
|---|-----------------------|---|---|
| IABP | Discrete (yes or no) | IABP (5330)=yes | |
| Other Mechanical Ventricular Support | Discrete (yes or no) | Other Mechanical Ventricular Support (5340)=yes | |
| Age <=70 | Discrete (yes or no) | DOB (2050); Arrival Date (3000) | |
| Age >70 | Linear or continuous* | DOB (2050); Arrival Date (3000) | Coefficient changes in weight with an increase in age >70 |
| Female | Discrete (yes or no) | Sex (2060) | |
| Body Mass Index <=30 | Discrete (yes or no) | Ht and Wt (4055 and 4060) | |
| Body Mass Index >30 | Linear or continuous* | Ht and Wt (4055 and 4060) | Coefficient changes in weight with an increase in BMI >30 |
| ST-segment elevation MI | Discrete (yes or no) | CAD presentation= STEMI (5000); or PCI indication=PCI for STEMI (7020 with codes 1,2,3,4,5) | |
| Pre-procedure hemoglobin <=13 | Discrete (yes or no) | Pre-Procedure Hemoglobin (7320) | |
| Pre-procedure hemoglobin >13 | Discrete (yes or no) | Pre-Procedure Hemoglobin (7320) | |
| Shock | Discrete (yes or no) | Shock w/in 24 hours (5060) or Shock at start of PCI (7030) | |
| Renal Failure | Discrete (yes or no) | Currently on Dialysis (4065); | |
| Glomerular filtration rate 30- 45 | Discrete (yes or no) | DOB (2050); Arrival Date (3000); Sex (2060), Race (2070-74), Pre-procedure Creatinine (7315) | |
| Glomerular filtration rate >45-60 | Discrete (yes or no) | DOB (2050); Arrival Date (3000); Sex (2060), Race (2070-74), Pre-procedure Creatinine (7315) | |
| Prior PCI | Discrete (yes or no) | Prior PCI (4035) | |

* Linear or continuous variables are typically variables that are numbers (weight, age, BMI). These variables have coefficients or weights that change based on the value of the variable.

Measure Display

Note: Procedures refers to the first (index) procedure for a patient within a hospital admission.

| Line | Label | Interpretation |
|------|---|--|
| 1818 | Risk Standardized Bleeding (RSB) - Pts with PCI | [Heading] |
| 1819 | Count of eligible procedures | Number of PCI procedures included in the measure for your facility. |
| 1820 | Procedures with an observed bleeding event | Number of PCI procedures which experienced a bleed among the procedures that were in the measure for your facility. |
| 1821 | Risk standardized bleeding ratio | Actual number of bleeds at your facility divided by the predicted number of bleeds at your facility given the patient mix. * SR Ratio <1: Site has fewer bleeds than the model predicted. (Relatively better performance) * SR Ratio >1: Site has more bleeds than the model predicted. (Relatively poorer performance) * SR Ratio =1: Site has same number of actual bleeds as the model predicted. (Expected performance) |
| 1822 | Risk adjusted bleeding rate (%) | Percent of PCI procedures that experienced a bleed for your facility, adjusted based on the patient case mix at your facility. |
| 1823 | Registry aggregate observed bleeding event rate (%) | Percent of PCI procedures (number of PCI procedures which experienced a bleed divided by the total number of PCI procedures in the measure) for ALL facilities in the registry. |
| 1824 | Lower 95% confidence interval of risk standardized adjusted bleeding rate | There is a 95% confidence that the true RSB rate for your facility is between the lower bound (this line) and upper bound (next line) specified. |
| 1825 | Upper 95% confidence interval of risk standardized adjusted bleeding rate | There is a 95% confidence that the true RSB rate for your facility is between the lower bound (previous line) and upper bound (this line) specified. |

Risk Model #3 – Metric 39 PCI in-hospital Risk Adjusted Acute Kidney Injury (all patients)

The PCI risk-adjusted acute kidney injury model was developed using patients in the CathPCI Registry discharged between July 1, 2009 and March 31, 2010. A total of 1,028,811 patients undergoing PCI at 1,231 hospitals in the United States were included in the model development and validation cohort.

Outcome:

Acute kidney injury, defined as Acute Kidney Injury Network (AKIN) stage 1 or greater or a new requirement for dialysis (8030) following PCI

- 1. Stage 1 is defined as an absolute increase of ≥ 0.3 mg/dL or a relative increase of 50% in serum creatinine (Cr)
- 2. Stage 2 is defined as an increase in serum Cr to more than 200% to 300% (>2-to 3-fold) from baseline,
- 3. Stage 3 is defined as increase in serum Cr to more than 300% (>3-fold) from baseline (or serum Cr of more than or equal to 4.0 mg/dl with an acute increase of at least 0.5 mg/dl.

NOTE: The AKIN criteria were created in part to be more sensitive to even small changes in creatinine. Previous epidemiologic studies have shown poor outcomes with creatinine increases as small as 0.3 mg/dl, hence the addition of the 0.3 mg/dl cut off to the AKIN stage 1 criteria. Also, the AKIN criteria for AKI are becoming the accepted standardized definition of AKI currently adopted by nephrology and critical care literature.

*Mehta RL, Kellum JA, Shah SV, Molitoris BA, Ronco C, Warnock DG, Levin A. Acute Kidney Injury Network: report of an initiative to improve outcomes in acute kidney injury. Crit Care. 2007;11(2):R31.

Model Eligibility and Population Definition

- Model eligibility at the <u>facility</u> level:
 - 1. Data submissions that passed NCDR data inclusion thresholds
- Model eligibility at the <u>patient</u> level:
 - 1. Include patient's with a PCI procedure performed during the Episode of Care
 - 2. Include only index PCI procedures when patients have multiple PCI procedures (subsequent PCIs during a single Episode of Care are excluded).
 - 3. Exclude patients with *either* a missing pre (7315) or a missing post procedure (7340) Creatinine value.
 - 4. Exclude patients 'Currently on Dialysis' (4065=Yes).
 - 5. Exclude patients with same day discharges. (Where 'Procedure Date' = 'Discharge Date')

Risk Adjusted Acute Kidney Injury (AKI) detail line labels in the Outcomes Report and explanations:

- Eligible Patients all patients who receive a predicted probability value from the model
- Observed AKI count of occurrences of AKI (number of patients who had AKI)
- Expected AKI predicted rate of AKI for the eligible patients (number of patients expected to have AKI)

• The **Observed/Expected Mortality Ratio** - (O/E Ratio) provides feedback on the comparison between the observed to expected

• Risk Adjusted Rate - your hospital risk adjusted AKI rate

• The **Registry Aggregate Observed AKI Rate** - the registry AKI rate and reflective of the patients included in the reporting period. It is therefore dynamic and changes based on these data from each quarter and R4Q

O/E Ratio x Registry Aggregate = Risk Adjusted Rate
